SKILLS

- Proficient in AWS and Azure for scalable, cloud-native data management and system architecture
- Expertise in designing and optimizing data pipelines using Snowflake and Azure Synapse
- Advanced SQL with experience in Fivetran and Azure Data Factory for robust data integration
- Proficient in workflow orchestration using Apache Airflow
- Strong full-stack development skills in React, Angular, and Python
- Skilled in data validation, cleansing, and applying medallion-style schemas for data quality
- Able to drive business insights and efficiency through scalable and maintainable data architecture
- Proven leadership in cross-functional engineering teams and cross-discipline collaboration
- extrovert-trained introvert

EDUCATION AND CERTIFICATIONS

Coding Dojo, 2021

Full Stack Developer Certification (MERN, Python, Java)

SUMMARY

Senior Data Engineer focused on architecting and owning scalable, production-grade data systems. Expertise in Snowflake, SQL, and dbt for building reliable transformation layers, with deep experience in large-scale data cleaning, enrichment, and pipeline optimization. Operates with high autonomy in lean environments, delivering end-to-end data solutions that directly improve application performance and data quality. Combines data engineering and full-stack experience to execute across the full data lifecycle.

EXPERIENCE

Curie.bio - (Contract) Sep 2025 - Current
Senior Data Engineer

- Design and maintain scalable data pipelines using Snowflake, SQL, and dbt for large-scale data transformation and modeling
- Build and manage dbt models, including testing and documentation, to improve data reliability and maintainability
- Lead large-scale data cleaning, normalization, and enrichment to support downstream application functionality
- Improve data quality and consistency across production systems, directly impacting application performance and usability
- Operate within a lean team, owning end-to-end data workflows and infrastructure decisions
- Work within a modern cloud environment leveraging AWS, Kubernetes, and PostgreSQL to support data infrastructure and services

Clearwater Analytics Sep 2024 - Sep 2025

Data Engineer II
Senior Data Engineer (Contract via TalentSpark) | Sep 2024 – Mar 2025

- Developed a full-stack enterprise application to automate DAG creation, reducing manual pipeline configuration
- Authored Airflow workflows with custom logic to process and transform complex datasets
- Standardized data ingestion processes and automated repetitive tasks, improving efficiency and data consistency

Gestalt Apr 2024 - Sep 2024

Senior Data Engineer

- Architected and maintained Snowflake-based data pipelines, optimizing performance and scalability for large datasets
- Implemented Fivetran integrations and AWS-based infrastructure to enable reliable, scalable data ingestion
- Designed data models and validation processes to improve data quality and support downstream analytics

Allata 2021 - Apr 2024

Senior Full Stack Engineer and Senior Data Engineer

- Led data engineering initiatives including large-scale data standardization, cleansing, and migration to modern cloud platforms (Azure Synapse, Databricks)
- Developed full-stack applications using Angular and Kotlin, delivering enterprise-grade solutions in a Fortune 100 environment
- Built AI-driven knowledge base systems leveraging AWS to improve internal data access and operational efficiency

PROJECTS

Resumancy 2023 - Current

Founder & Lead Engineer

- Built an AI-driven resume and cover letter generation platform tailored to job descriptions, including skills gap analysis and match scoring.
- Developed full-stack application using React, Node.js, and OpenAI APIs with a focus on minimal hallucination and fast, accurate resume tailoring.
- Drove ~10K page views, successfully helped early users secure higher-paying jobs.

CrimsonScan - Spectra 2025 - Current

Founder & Lead Engineer

- Architected and built an end-to-end AI-driven materials discovery platform, translating user input into candidate generation, simulation, and analysis workflows
- Orchestrate generative and scientific models (e.g., GT4SD, MatterGen, PyMatGen) to produce, evaluate, and rank novel material candidates at scale
- Developed automated pipelines for property prediction, DFT-based validation, and generation of economic analyses and patent-ready documentation
